

FIREPLACE VENTILATION

Model #045 Tubular Outside Air Intake Kit is suitable for new fireplace construction, or can be installed in existing ones to improve the efficiency. Outside air greatly reduces the drain of heat from your home and reduces the possibility of smoke damage as well.

Due to the telescoping design, the unit can adapt through from 15" to 22" of masonry.

For aesthetic purposes, the installer may prefer a Brick Vent or Block Vent on the exterior wall, replacing the Plastic Vent.

On fireplaces larger than 48 inches, 2 units would be recommended.
